Reg nr 33/92**SEMI-HIDDEN EVAPORATOR ON MA CABINETS****Product Information**

A new semi-hidden refrigeration evaporator is now gradually being introduced on all fridges and fridge/freezers from Mariestad. The evaporator is completely flat on the side facing towards the cabinet, and it is secured in two vertical grooves in the inner linear. This design has enabled the factory to combine good refrigeration properties with an attractive appearance.

Service work**Replacing the evaporator:**

First push the evaporator to the right into the right-hand vertical groove. The evaporator can then be bent to remove it from the left-hand side.

**Changing the thermostat.**

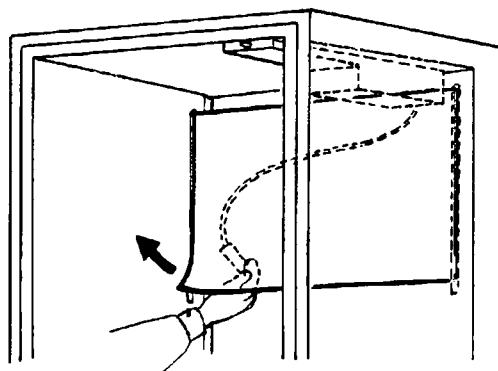

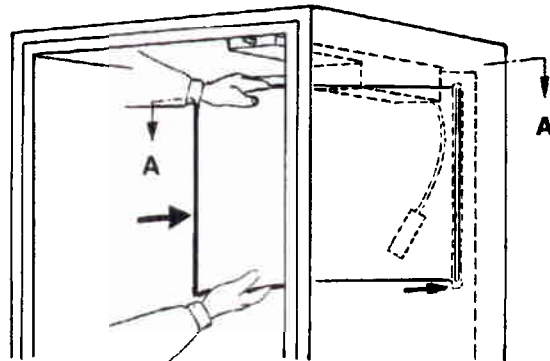

On certain earlier models, the thermostat bulb is located in a duct on the right-hand side of the evaporator. Over a period of time, the duct will be moved over to the left-hand side, which will make it easier to change the thermostat.

a) Thermostat bulb on the right-hand side:

To change the thermostat, the entire evaporator must be loosened as described above.

b) Thermostat on the left-hand side:

By carefully prising out the lower left-hand corner of the evaporator, the thermostat bulb, which is mounted as a hair-grip in the evaporator duct, can be released with the hand. The entire capillary tube of the thermostat can then be withdrawn up from the control unit. Refit in the reverse order.
