Dishwashers for installation in height

As of 2004, DGN has manufactured some dishwasher models which can be installed in height. These dishwashers have standard equipment of discharge hose ventilation.

Dishwashers for height installation which are not yet equipped with discharge hose ventilation, can be reequipped by customer service if any problems should arise.

The kit has **PN 407133490/0** and is installed as shown on the image.

Cable fasteners

If necessary, you should reuse the angular bush from the old discharge hose.

As all the regenerating distributors do not have connection pieces for the ventilation hose, customer service may install the ventilation hose in other than standard ways. As the figure shows, the ventilation hose is installed, on the one hand, up to upper edge of the machine and then into the base trough. Although the ball valve at the beginning of the ventilation hose might not close perfectly, no water will penetrate into the base trough, even if the machine is installed in height.
