Issue: 1
Date: 6/16

Intermittent Faults Control Panel

Fault: The controller is unresponsive to touch, randomly changes its function, temperature or the graphics appear to have lines through them.

The most probable cause is the brackets which hold the controller in place against the control panel glass. There was an issue with the fixing method of the brackets which was resolved at serial number 45020001.

Fix: Change the control panel only. (spares stock has been replaced with good parts)
